

What is claimed is:

1. A transceiver cage to accommodate a transceiver module, comprising  
a housing including a top plate, a bottom plate, a back plate , the first side  
plate and the second side plate and having an opening in the front to  
5 accommodate the transceiver module,

at least one resilience piece protruding by a predetermined distance  
from the back plate side toward the front side in the housing,

a latch member holding the transceiver module accommodated in the  
housing against a force of the resilience piece, wherein

10 by locking and releasing of the latch member between the transceiver  
module and the transceiver cage, the transceiver module is attached in and  
detached from the transceiver cage,

the resilience piece having

a first bend section constitutes an end portion for joining the housing  
15 and the resilience piece on the back plate side,

a second bend section constitutes an end portion on the protruding side,  
and at least one further bend section provided between the first bend  
section and the second bend section.
